

1 Problem sheet 5: Lectures 21-26

1.1 Problem 1

This problem considers Cauchy and Logarithmic transforms of Laguerre polynomials. Recall from lectures that

$$\mathcal{C}_{[0,\infty)}[e^{-\diamond}](z) = -\frac{e^{-z}\text{Ei } z}{2\pi i}$$

for the exponential integral

$$\text{Ei } z = \int_{-\infty}^z \frac{e^{\zeta}}{\zeta} d\zeta.$$

1. What is

$$\mathcal{C}_{[0,\infty)}[\diamond e^{-\diamond} L_1^{(1)}(\diamond)](z) := \frac{1}{2\pi i} \int_0^\infty \frac{x e^{-x} L_1^{(1)}(x)}{x - z} dx$$

in terms of $\text{Ei } z$?

2. What is

$$\frac{1}{\pi} \int_0^\infty e^{-x} L_2(x) \log |z - x| dx$$

in terms of the real and imaginary parts of $\text{Ei } z$?

1.2 Problem 2

Consider the incomplete Gamma function:

$$\Gamma(\alpha, z) = \int_z^\infty \zeta^{\alpha-1} e^{-\zeta} d\zeta,$$

where the contour of integration is two straight line segments from z to 1 to ∞ , hence this has a branch cut on $(-\infty, 0]$.

1. For $x < 0$ and $\alpha > 0$, show that

$$\Gamma_+(\alpha, x) - e^{2i\pi\alpha}\Gamma_-(\alpha, x) = (1 - e^{2i\pi\alpha})\Gamma(\alpha)$$

where $\Gamma(\alpha) = \Gamma(\alpha, 0) = \int_0^\infty x^{\alpha-1}e^{-x}dx$ is the Gamma function and

$$\Gamma_\pm(\alpha, x) = \lim_{\epsilon \rightarrow 0} \Gamma(\alpha, x \pm i\epsilon).$$

2. For $-1 < \alpha < 0$, express

$$\mathcal{C}_{[0,\infty)}[\diamond^\alpha e^{-\diamond}](z) = \frac{1}{2\pi i} \int_0^\infty \frac{x^\alpha e^{-x}}{x - z} dx$$

in terms of $\Gamma(-\alpha, -z)$ and $(-z)^\alpha e^z$ using Plemelj's lemma.

1.3 Problem 3

Define

$$a(z) = z^2 - 4 + z^{-2}.$$

1. What are the entries of $L[a(z)]^{-1}$?
2. Find the WienerHopf factorisation

$$a(z) = \phi_+(z)\phi_-(z)$$

where $\phi_+(z)$ is analytic inside the unit circle and $\phi_-(z)$ is analytic outside, with $\phi_-(\infty) = 1$.

3. Find the UL decomposition

$$T[a(z)] = UL$$

where U is upper-triangular with 1 on the diagonal and L is lower triangular.

4. What is $T[a(z)]^{-1}$?
 5. What is $T[(z^2 + 3)/(z^2 + 2)]^{-1}$?
-

1.4 Problem 4

When the winding number is non-trivial, a Toeplitz operator can either be non-invertible or have multiple solutions. This problem sheet explores this.

1. What is the winding number of $a(z) = z$? Show that

$$T[z]\mathbf{u} = \mathbf{f}$$

only has a solution if f_0 (the first entry of \mathbf{f}) is zero.

2. What is the winding number of $a(z) = z^{-1}$? What are *all* solutions to

$$T[z^{-1}]\mathbf{u} = \mathbf{f}?$$

3. Show that if $a(z)$ has winding number κ it can be written as

$$a(z) = \phi_+(z)z^\kappa\phi_-(z)$$

What are $\phi_+(z)$ and $\phi_-(z)$ in terms of $\log(a(z)z^{-\kappa})$?

4. Show that if the winding number is κ there exists a

$$T[a(z)] = UPL$$

decomposition, where

$$P = T[z^\kappa]$$

is a permutation operator.

5. Find all solutions to

$$T[1/(2z^2 + 1)]\mathbf{u} = \mathbf{e}_0$$

1.5 Problem 5

This set of problems investigates the analyticity properties of the half-Fourier transform. Recall the definitions

$$u_R(x) = \begin{cases} u(x) & x \geq 0 \\ 0 & \text{otherwise} \end{cases},$$

$$u_L(x) = \begin{cases} u(x) & x < 0 \\ 0 & \text{otherwise} \end{cases},$$

The Fourier transform

$$\hat{u}(s) = \int_{-\infty}^{\infty} u(x)e^{-ixs}dx,$$

and the inverse Fourier transform

$$u(x) = \frac{1}{2\pi} \int_{-\infty+i\gamma}^{\infty+i\gamma} \hat{u}(s)e^{isx}ds$$

where the choice of γ is dictated by the analyticity of $\hat{u}(z)$.

1. Consider $f(x) = x$. Without computing it, in what strip, if any, is $\hat{f}(z)$ analytic? For what choice of γ , if any, does the inverse Fourier transform recover f ?
2. Consider $f(x) = \frac{1}{1+e^x}$. Without computing it, in what strip, if any, is $\hat{f}(z)$ analytic? For what choice of γ , if any, does the inverse Fourier transform recover f ?
3. Consider $f(x) = e^{2x}$. Without computing it, in what strip, if any, is $\widehat{f_R}(z)$ analytic? For what choice of γ , if any, does the inverse Fourier transform recover f ?
4. Consider $f(x) = x$. Without computing it, in what strip, if any, is $\widehat{f_L}(z)$ analytic? For what choice of γ , if any, does the inverse Fourier transform recover f ?
5. Calculate the Fourier transforms in the above problems and confirm your statements.
6. What is the Fourier transform of $\delta(x)$, i.e., the Dirac delta function satisfying

$$\int_{-\infty}^{\infty} \delta(x)g(x)dx = g(0)$$

for smooth test functions g . Where is it analytic?

1.6 Problem 6

This set of problems considers extensions of the WienerHopf method to functions that do not decay, degenerate integral equations, and to integro-differential equations. Please be precise on which contour the RiemannHilbert problem is solved on and the inverse Fourier transforms taken.

1. The function $u(x)$ is bounded by a polynomial for all $x \geq 0$, including as $x \rightarrow \infty$, and satisfies the integral equation

for $x \geq 0$,

$$u(x) + \frac{3}{2} \int_0^{\infty} e^{-|x-t|} u(t) dt = 1 + \alpha x$$

where α is a positive constant. Find $u(x)$ for $x \geq 0$. Hint: set up a RiemannHilbert problem on the contour $\mathbb{R} + i\gamma$ where $-1 < \gamma < 0$ is arbitrary.

2. The function $u(x)$ is bounded by a polynomial for all $x \geq 0$, including as $x \rightarrow \infty$, and satisfies the integral equation

for $x \geq 0$,

$$\int_0^{\infty} e^{-\alpha|x-t|} u(t) dt = 1 + \alpha x$$

where α is a positive constant. Find $u(x)$ for $x \geq 0$. Hint: If you proceed naively, we arrive at a RiemannHilbert problem of the form

$$\Phi_+(s) - g(s)\Phi_-(s) = f(s) \quad \text{and} \quad \lim_{z \rightarrow \infty} \Phi(z) = 0$$

but where $g(\infty) = 0$ instead of $g(\infty) = 1$. This is not in canonical form, but maybe this example is special. Try writing $\Phi(z) = \kappa(z)Y(z)$ as before but allowing different asymptotic behaviour in κ and Y in the different half planes in a way that they cancel out so that $\lim_{z \rightarrow \infty} \Phi(z) = 0$:

$$\kappa(z) = \begin{cases} O(z^{-1}) & \Im z > 0 \\ O(z) & \Im z < 0 \end{cases}$$

$$Y(z) = \begin{cases} O(1) & \Im z > 0 \\ O(z^{-2}) & \Im z < 0 \end{cases}.$$

3. Consider the integral equation

$$u(t) - \lambda \int_0^\infty e^{-|x-t|} u(t) dt = x$$

where $0 < \lambda < \frac{1}{2}$. Show that, for $x \geq 0$,

$$u(x) = A(\sinh \gamma x + \gamma \cosh \gamma x) + \frac{1}{\gamma^2} \left[x + \left(\gamma - \frac{1}{\gamma} \right) \sinh \gamma x \right]$$

where $\gamma^2 = 1 - 2\lambda$ and A is an arbitrary constant.

1.7 Problem 7

A bounded, smooth, function $u(x)$ satisfies the integro-differential equation

$$u''(x) - \frac{72}{5} \int_0^\infty e^{-5|x-t|} u(t) dt = 1 \quad \text{for} \quad x \geq 0$$

with $u(0) = 0$.

1. Rewrite the integral equation on the half line in the form:

$$u''_{\text{R}}(x) - \frac{72}{5} \int_{-\infty}^\infty e^{-5|x-t|} u(t) dt = 1_{\text{R}}(x) + \alpha \delta(x) + p_{\text{L}}(x)$$

for $\alpha = u'(0)$ and a to-be-specified $p(x)$. Here δ is the Dirac delta function, that is, $\int_{-\infty}^\infty f(x) \delta(x) dx = f(0)$.

2. Use integration by parts to determine that

$$\widehat{u''_{\text{R}}}(s) = -u'(0) - s^2 \widehat{u_{\text{R}}}(s).$$

What is $\widehat{\delta}(s)$? Use these to translate the equation to Fourier space on a contour $s \in \mathbb{R} + i\gamma$. What choices of γ are suitable?

3. Define $\Phi(z)$ in terms of $\widehat{p_L}(z)$ and $\widehat{u_R}(z)$ so that it satisfies the following (non-standard) RH problem

$$\begin{aligned}\Phi_+(s) - \frac{(s^2 + 9)(s^2 + 16)}{s^2 + 25} \Phi_-(s) &= \alpha + \frac{1}{is} \\ \lim_{\substack{z \rightarrow \infty \\ \Im z > \gamma}} \Phi(z) &= \alpha \\ \lim_{\substack{z \rightarrow \infty \\ \Im z < \gamma}} \Phi(z) &= 0.\end{aligned}$$

4. Solve the RiemannHilbert problem for Φ . Hint: write $\Phi(z) = \kappa(z)Y(z)$ where

$$\begin{aligned}\kappa(z) &= \begin{cases} O(z) & \Im z > \gamma \\ O(z^{-1}) & \Im z < \gamma \end{cases}, \\ Y(z) &= O(z^{-1}).\end{aligned}$$

Hint: $Y(z)$ does not depend on α in the lower-half plane.

5. Recover $u(x)$ by taking the inverse Fourier transform of $\Phi_-(s)$.
