# 1 Problem sheet 5: Lectures 21-26

#### 1.1 Problem 1

This problem considers Cauchy and Logarithmic transforms of Laguerre polynomials. Recall from lectures that

$$\mathcal{C}_{[0,\infty)}[e^{-\diamond}](z) = -\frac{e^{-z} \operatorname{Ei} z}{2\pi i}$$

for the exponential integral

$$\operatorname{Ei} z = \int_{-\infty}^{z} \frac{e^{\zeta}}{\zeta} d\zeta.$$

1. What is

$$\mathcal{C}_{[0,\infty)}[\diamond \mathrm{e}^{-\diamond}L_1^{(1)}(\diamond)](z) := \frac{1}{2\pi\mathrm{i}} \int_0^\infty \frac{x \mathrm{e}^{-x} L_1^{(1)}(x)}{x - z} \mathrm{d}x$$

in terms of Eiz?

2. What is

$$\frac{1}{\pi} \int_0^\infty e^{-x} L_2(x) \log|z - x| dx$$

in terms of the real and imaginary parts of Eiz?

### 1.2 Problem 2

Consider the incomplete Gamma function:

$$\Gamma(\alpha, z) = \int_{z}^{\infty} \zeta^{\alpha - 1} e^{-\zeta} d\zeta,$$

where the contour of integration is two straight line segments from z to 1 to  $\infty$ , hence this has a branch cut on  $(-\infty, 0]$ .

1

1. For x < 0 and  $\alpha > 0$ , show that

$$\Gamma_{+}(\alpha, x) - e^{2i\pi\alpha}\Gamma_{-}(\alpha, x) = (1 - e^{2i\pi\alpha})\Gamma(\alpha)$$

where  $\Gamma(\alpha)=\Gamma(\alpha,0)=\int_0^\infty x^{\alpha-1}{\rm e}^{-x}{\rm d}x$  is the Gamma function and

$$\Gamma_{\pm}(\alpha, x) = \lim_{\epsilon \to 0} \Gamma(\alpha, x \pm i\epsilon).$$

2. For  $-1 < \alpha < 0$ , express

$$C_{[0,\infty)}[\diamond^{\alpha} e^{-\diamond}](z) = \frac{1}{2\pi i} \int_0^{\infty} \frac{x^{\alpha} e^{-x}}{x-z} dx$$

in terms of  $\Gamma(-\alpha,-z)$  and  $(-z)^{\alpha}\mathrm{e}^z$  using Plemelj's lemma.

### 1.3 Problem 3

Define

$$a(z) = z^2 - 4 + z^{-2}$$
.

- 1. What are the entries of  $L[a(z)]^{-1}$ ?
- 2. Find the WienerHopf factorisation

$$a(z) = \phi_+(z)\phi_-(z)$$

where  $\phi_+(z)$  is analytic inside the unit circle and and  $\phi_-(z)$  is analytic outside, with  $\phi_-(\infty) = 1$ .

3. Find the UL decomposition

$$T[a(z)] = UL$$

where U is upper-triangular with 1 on the diagonal and L is lower triangular.

- 4. What is  $T[a(z)]^{-1}$ ?
- 5. What is  $T[(z^2+3)/(z^2+2)]^{-1}$ ?

### 1.4 Problem 4

When the winding number is non-trivial, a Toeplitz operator can either be non-invertible or have multiple solutions. This problem sheet explores this.

1. What is the winding number of a(z) = z? Show that

$$T[z]\mathbf{u} = \mathbf{f}$$

only has a solution if  $f_0$  (the first entry of  $\mathbf{f}$ ) is zero.

2. What is the winding number of  $a(z) = z^{-1}$ ? What are all solutions to

$$T[z^{-1}]\mathbf{u} = \mathbf{f}?$$

3. Show that if a(z) has winding number  $\kappa$  it can be written as

$$a(z) = \phi_{+}(z)z^{\kappa}\phi_{-}(z)$$

What are  $\phi_{+}(z)$  and  $\phi_{-}(z)$  in terms of  $\log(a(z)z^{-\kappa})$ ?

4. Show that if the winding number is  $\kappa$  there exists a

$$T[a(z)] = UPL$$

decomposition, where

$$P = T[z^{\kappa}]$$

is a permutation operator.

5. Find all solutions to

$$T[1/(2z^2+1)]\mathbf{u} = \mathbf{e}_0$$

#### 1.5 Problem 5

This set of problems investigates the analyticity properties of the half-Fourier transform. Recall the definitions

$$u_{\rm R}(x) = \begin{cases} u(x) & x \ge 0 \\ 0 & \text{otherwise} \end{cases},$$

$$u_{\rm L}(x) = \begin{cases} u(x) & x < 0 \\ 0 & \text{otherwise} \end{cases},$$

The Fourier transform

$$\hat{u}(s) = \int_{-\infty}^{\infty} u(x) e^{-ixs} dx,$$

and the inverse Fourier transform

$$u(x) = \frac{1}{2\pi} \int_{-\infty + i\gamma}^{\infty + i\gamma} \hat{u}(s) e^{isx} ds$$

where the choice of  $\gamma$  is dictated by the analyticity of  $\hat{u}(z)$ .

- 1. Consider f(x) = x. Without computing it, in what strip, if any, is  $\hat{f}(z)$  analytic? For what choice of  $\gamma$ , if any, does the inverse Fourier transform recover f?
- 2. Consider  $f(x) = \frac{1}{1+e^x}$ . Without computing it, in what strip, if any, is  $\hat{f}(z)$  analytic? For what choice of  $\gamma$ , if any, does the inverse Fourier transform recover f?
- 3. Consider  $f(x) = e^{2x}$ . Without computing it, in what strip, if any, is  $\widehat{f}_{R}(z)$  analytic? For what choice of  $\gamma$ , if any, does the inverse Fourier transform recover f?
- 4. Consider f(x) = x. Without computing it, in what strip, if any, is  $\widehat{f}_{L}(z)$  analytic? For what choice of  $\gamma$ , if any, does the inverse Fourier transform recover f?
- 5. Calculate the Fourier transforms in the above problems and confirm your statements.
- 6. What is the Fourier transform of  $\delta(x)$ , i.e., the Dirac delta function satisfying

$$\int_{-\infty}^{\infty} \delta(x)g(x)dx = g(0)$$

for smooth test functions g. Where is it analytic?

## 1.6 Problem 6

This set of problems considers extensions of the WienerHopf method to functions that do not decay, degenerate integral equations, and to integro-differential equations. Please be precise on which contour the RiemannHilbert problem is solved on and the inverse Fourier transforms taken.

1. The function u(x) is bounded by a polynomial for all  $x \ge 0$ , including as  $x \to \infty$ , and satisfies the integral equation

for  $x \geq 0$ ,

$$u(x) + \frac{3}{2} \int_0^\infty e^{-|x-t|} u(t) dt = 1 + \alpha x$$

where  $\alpha$  is a positive constant. Find u(x) for  $x \geq 0$ . Hint: set up a RiemannHilbert problem on the contour  $\mathbb{R} + i\gamma$  where  $-1 < \gamma < 0$  is arbitrary.

2. The function u(x) is bounded by a polynomial for all  $x \ge 0$ , including as  $x \to \infty$ , and satisfies the integral equation

for  $x \ge 0$ ,

$$\int_0^\infty e^{-\alpha|x-t|} u(t) dt = 1 + \alpha x$$

where  $\alpha$  is a positive constant. Find u(x) for  $x \geq 0$ . Hint: If you proceed na\"\i vely, we arrive at a RiemannHilbert problem of the form

$$\Phi_{+}(s) - g(s)\Phi_{-}(s) = f(s)$$
 and  $\lim_{s \to \infty} \Phi(\infty) = 0$ 

but where  $g(\infty) = 0$  instead of  $g(\infty) = 1$ . This is not in canonical form, but maybe this example is special. Try writing  $\Phi(z) = \kappa(z)Y(z)$  as before but allowing different asymptotic behaviour in  $\kappa$  and Y in the different half planes in a way that they cancel out so that  $\lim_{z\to\infty} \Phi(z) = 0$ :

$$\kappa(z) = \begin{cases} O(z^{-1}) & \Im z > 0 \\ O(z) & \Im z < 0 \end{cases}$$
$$Y(z) = \begin{cases} O(1) & \Im z > 0 \\ O(z^{-2}) & \Im z < 0 \end{cases}.$$

3. Consider the integral equation

$$u(t) - \lambda \int_0^\infty e^{-|x-t|} u(t) dt = x$$

where  $0 < \lambda < \frac{1}{2}$ . Show that, for  $x \ge 0$ ,

$$u(x) = A(\sinh \gamma x + \gamma \cosh \gamma x) + \frac{1}{\gamma^2} \left[ x + \left( \gamma - \frac{1}{\gamma} \right) \sinh \gamma x \right]$$

where  $\gamma^2 = 1 - 2\lambda$  and A is an arbitrary constant.

## 1.7 Problem 7

A bounded, smooth, function u(x) satisfies the integro-differential equation

$$u''(x) - \frac{72}{5} \int_0^\infty e^{-5|x-t|} u(t) dt = 1$$
 for  $x \ge 0$ 

with u(0) = 0.

1. Rewrite the integral equation on the half line in the form:

$$u_{\rm R}''(x) - \frac{72}{5} \int_{-\infty}^{\infty} e^{-5|x-t|} u(t) dt = 1_{\rm R}(x) + \alpha \delta(x) + p_{\rm L}(x)$$

for  $\alpha = u'(0)$  and a to-be-specified p(x). Here  $\delta$  is the Dirac delta function, that is,  $\int_{-\infty}^{\infty} f(x)\delta(x)dx = f(0)$ .

2. Use integration by parts to determine that

$$\widehat{u_{\rm R}''}(s) = -u'(0) - s^2 \hat{u}_{\rm R}(s).$$

What is  $\hat{\delta}(s)$ ? Use these to translate the equation to Fourier space on a contour  $s \in \mathbb{R} + i\gamma$ . What choices of  $\gamma$  are suitable?

3. Define  $\Phi(z)$  in terms of  $\widehat{p_L}(z)$  and  $\widehat{u_R}(z)$  so that it satisfies the following (non-standard) RH problem

$$\Phi_{+}(s) - \frac{(s^2 + 9)(s^2 + 16)}{s^2 + 25} \Phi_{-}(s) = \alpha + \frac{1}{is}$$

$$\lim_{\substack{z \to \infty \\ \Im z > \gamma}} \Phi(z) = \alpha$$

$$\lim_{\substack{z \to \infty \\ \Im z < \gamma}} \Phi(z) = 0.$$

4. Solve the Riemann Hilbert problem for  $\Phi.$  Hint: write  $\Phi(z)=\kappa(z)Y(z)$  where

$$\kappa(z) = \begin{cases} O(z) & \Im z > \gamma \\ O(z^{-1}) & \Im z < \gamma \end{cases},$$
 
$$Y(z) = O(z^{-1}).$$

Hint: Y(z) does not depend on  $\alpha$  in the lower-half plane.

5. Recover u(x) by taking the inverse Fourier transform of  $\Phi_{-}(s)$ .
